LAB 6

CS545 – React Introduction

This lab you will make your first react application using the `create-react-app` command.

- First create a container component called **Dashboard**
- Then make a component called **Post** that holds information like the example below.
- Create a component that will render all the posts called **Posts**
- Put the posts information in an array of **Post** objects, then render three different components on the **Dashboard**.
- In the Dashboard component, add a **Textfield** and **Button** to update the first components' Title.

Optional

- Make component that will be placed in the **Dashboard** that will show the post details in its own block after clicking on one of the **Post** components. It should show two options edit and delete the post. You are not required to activate these options, just provide some buttons.

Post

Id: 111	Id: 112	Id: 113
Title: Happiness	Title: MIU	Title: Enjoy Life
Author: John	Author: Dean	Author: Jasmine

Change Name

PostDetails

MIU

Dean

This is the content in the post…
